Agenda

Heap Sort

Kth largest element

Sort nearly sorted array

Median of stream of integers

Q → Sort an Array

We want to sort an array in increasing order using a heap

Idea 1: Create a min heap and continuously extract min for n times

① Build a heap

② Extract min and store ans in array

Quiz 1

What is the time complexity to convert an array to a heap?

$O(n)$

Quiz 2

Root element in heap is _____?

depends on either min or max heap

Sorting an array using heap

① Build a Heap → $O(n)$

② Extract Min for n times → $O(n \log n)$

T.C = $O(n \log n)$ S.C = $O(n)$

Can we optimize space complexity?

Hint: Use a max Heap

h =

14	13	10	7	6	8	5	2	1	3
0	1	2	3	4	5	6	7	8	9

Visualize

we can extract the max element from Heap
= 14

h =

14	13	10	7	6	8	5	2	1	3
0	1	2	3	4	5	6	7	8	9

$h =$

13	7	10	3	6	8	5	2	1	14
0	1	2	3	4	5	6	7	8	9

Reduce the size of array by 1, subarray $[0, 8]$

$h =$

13	7	10	3	6	8	5	2	1	14
0	1	2	3	4	5	6	7	8	9

extract max & heapify (root)

Repeat the following steps N times

- ① extract max & heapify 0th index
- ② Reducing size of heap and performing above step N time

pseudo code

// Build max heap from array

$j = n - 1;$

while $(j > 0)$

 | swap $(A[j], A[0])$;

\downarrow

heapify (0, heap, P);

T.C = $O(N \log N)$

S.C = $O(1)$

In place sorting \rightarrow no additional space, Heap sort is In place

Stable sorting \rightarrow are you maintaining order of input

Heap sort is not stable

Q \rightarrow Kth largest element

Given arr[N], Find the Kth largest element

arr =

0	1	2	3	4	5	6
8	5	1	2	4	9	7

, K = 3

\downarrow Second largest \downarrow First largest

ans = 7

Ans 3

What is the 5th largest element of an array

1	2	3	4	5
---	---	---	---	---

ans = 1

Idea 1 : Sort the array in decreasing order
return arr[k-1]

$$T.C = O(n \log n)$$

Idea 2: Using heap sort k steps (max)

1) Build a max heap $\rightarrow O(n)$

2) For k times extract max $\rightarrow O(k \log n)$

$$T.C = O(k \log n)$$

Idea 3 : Using min heap

example: Imagine you are in a cricket selection and you have to pick 2 batsmen out of 6 batsmen

12	8	9	4	6	11
----	---	---	---	---	----

When you see third batsman score more than lowest score so far, replace him with high score

when you see a person score less than existing selected least score, you will ignore them

The min element in our selection represents 2nd largest high scorer from the pack

Example

Create a min heap of size k

arr[i]	h[i]	arr[i] > h[i]	Remark
2	1	2 > 1	Replace 1
4	2	4 > 2	Replace 2
9	4	9 > 4	Replace 4
7	5	7 > 5	Replace 5

Third greatest is root of heap → 7

pseudo Code

```
int get kth largest Element (arr[], k) {  
    heap []  
    for (i=0; i<k; i++) {  
        | heap.append (arr[i]);  
        |  
        | heapify (heap); // min heap  
    }  
    for (i=k; i<n; i++) {  
        | if (arr[i] > heap[0]) {  
            | | heap.extract-min();  
            | | heap.insert (arr[i]);  
        }  
    }  
    return heap[0];  
}
```

$$T.C = O(n-k \log k) \quad S.C = O(k)$$

Q → Find the k^{th} largest element for all windows of an array starting from 0th index

$$\begin{array}{cccccc} 0 & 1 & 2 & 3 & 4 & 5 & 6 \\ \text{arr} = & \boxed{10} & \boxed{18} & \boxed{7} & \boxed{5} & \boxed{16} & \boxed{19} & \boxed{3} \end{array} \quad k=3$$

s	e	array elements	ans array
0	2	10, 18, 7	7
0	3	10, 18, 7, 5	7, 7
0	4	10, 18, 7, 5, 16	7, 7, 10
0	5	10, 18, 7, 5, 16, 19	7, 7, 10, 16
0	6	10, 18, 7, 5, 16, 19, 3	7, 7, 10, 16, 16

~~10, 18~~
~~7, 16~~
 19

Min Heap

Ques 4

Find the k^{th} largest element for all windows of an array starting from 0 index

$$\begin{array}{ccccc} \text{arr} = & \boxed{5} & \boxed{4} & \boxed{1} & \boxed{6} & \boxed{7} \\ & 0 & 1 & 2 & 3 & 4 \end{array} \quad k=2$$

5, 4

a) create a Min heap of size k Min Heap

b) for all i , check if $\text{arr}[i] > \text{heap}[0]$
 extract min & insert $\text{arr}[i]$ to heap

c) root will give the ans

Q → Given a nearly sorted array. You need to sort the array

Nearly sorted array → Every element is shifted away from its correct position by at most k steps

Example

$k=4$

Idea 1

Sort the array

T.C = $O(n \log n)$

S.C = $O(1)$

Idea 2

Since each element can be k steps away the smallest element will be in range $[0, k+1]$

MIN HEAP of size $k+1$

to store all elements in window

DRY RUN

13	22	31	45	11	20	48	60	50
0	1	2	3	4	5	6	7	8

$k=4$

- ① Add all elements from $[0, k]$ to my heap
- ② Iterate from $k+1$ to n
 - a) extract min
 - b) add $arr[i]$ to heap
- ③ Till heap is not empty, keep extracting min

pseudo code

heap = []

for ($i=0$; $i \leq k$; $i++$) {

 heap.append($arr[i]$);

heapify(heap) // min heap $O(k)$

for ($i=k+1$; $i < n$; $i++$) {

 ans.append(heap.extractmin());

 heap.insert($arr[i]$);

while (!heap.empty()) {

 ans.append(heap.extractmin());

 T.C = $O(n \log k)$

Q → Given an infinite stream of integers. Find the median of the current set of elements.

Median is the middle element in sorted array

The median of

1	2	5	4	3	6
---	---	---	---	---	---

① Sort the array

1	2	3	4	5	6
---	---	---	---	---	---

middle ele

② median $\frac{3+4}{2} = 3.5$

Quiz 5

Median of

1	2	4	3
---	---	---	---

$$\text{median} = \frac{2+3}{2} = 2.5$$

Brute Force

I/P → 9 8 4 6 7 12 15 ...

Median → 9 8.5 8 7

For every input add it to end of array and sort it.

$$T.C = O(n^2 \log n)$$

Idea 2 For every input insert it in correct position and calculate median

$$T.C = O(n^2)$$

Idea 3

I/P \rightarrow 9 8 4 6 7 12 15 ...

Max Heap

Min Heap

(odd)

Ans \rightarrow try to store my ans in root of Max heap (or)

$$\frac{\text{root of max heap} + \text{root of min heap}}{2}$$

(even)

$$\text{size of max heap} - \text{size of min heap} = \{0, 1\}$$

I/P \rightarrow 9 8 4 6 7 12 15 ...

9 8.5 8 7 7 7.5 8

Max Heap

Min Heap

* Input x

If ($x \leq \text{root of max heap}$)

→ Insert x in max heap

else → Insert x in min heap

$ds = \text{max heap size} - \text{min heap size}$

If ($ds > 1$) remove root from max heap
& Insert in min heap

If ($ds < 0$) remove root from min heap
& Insert in max heap

length (odd) → root of max heap
and

length (even) → $\frac{\text{root (max)} + \text{root (min)}}{2}$
